

ComIn Plugins

ICON Community Interface

Mahnoosh Haghighatnasab and ComIn Developer Team
DWD, DLR, DKRZ, FZJ | DWD Academic ICON Course |
23 July 2025

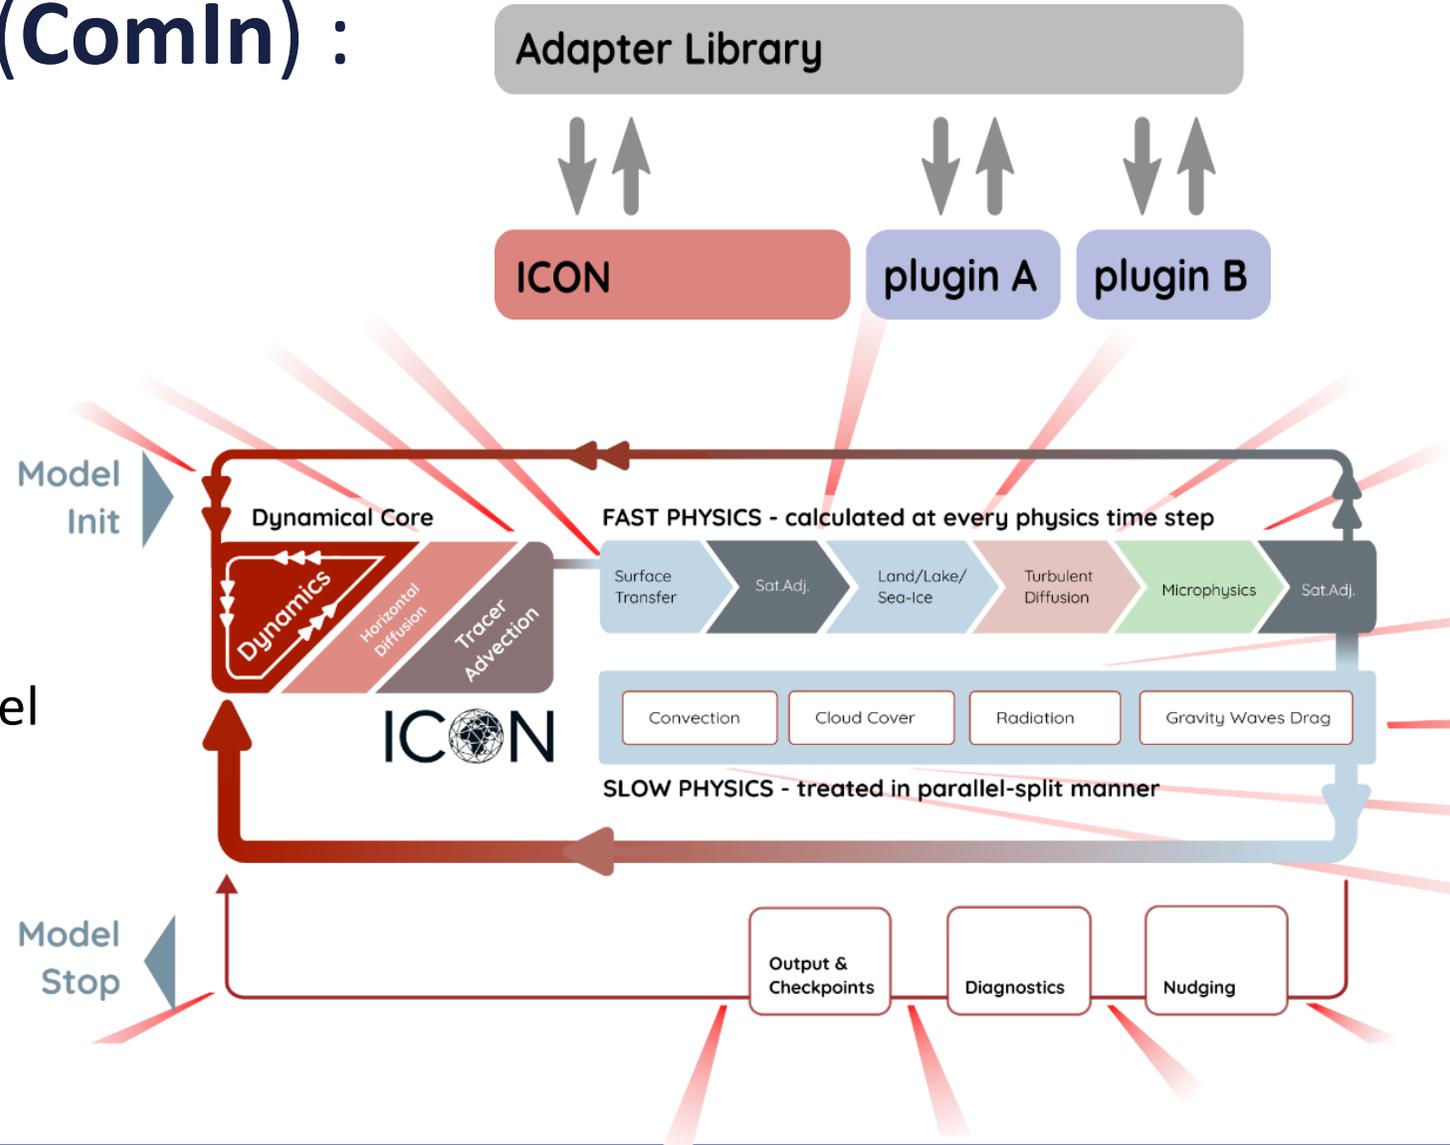

ICON Control Flow

- Release **ICON 2024.10** Fortran and C code: **1,123,740** lines
- Where should my implementations go?
- Going through review process
- Difficult to maintain

ICON Community Interface (ComIn) :

- Connects plugins to the ICON host model
- Plugin functions are called at pre-defined events (Entry Points)
- Regulates the access and creation of model variables
- Guaranties stable interface for external projects

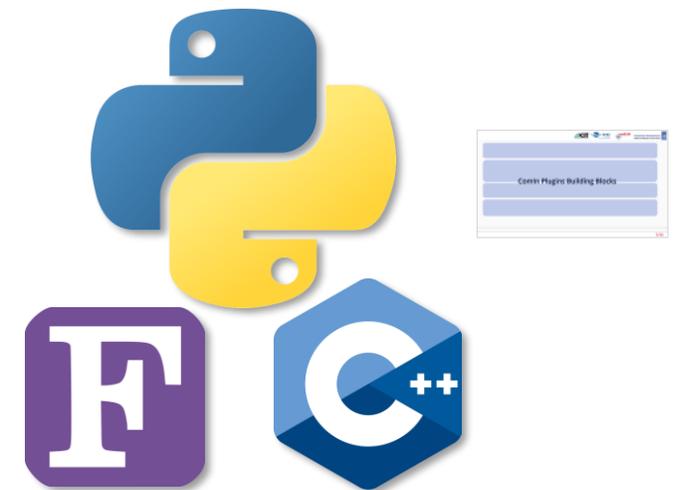

Plugin mechanism for ICON

Behind the scenes: dynamic linking

- ComIn relies on dynamic linking to implement the plugin functionality.
- *Dynamic/shared linking*: operating system loads the necessary shared libraries into memory at runtime

Language interoperability in plugins

- **Shared libraries** for Fortran or C/C++ plugins
- **Python plugins** do not need any compilation process

ComIn Plugins Building Blocks

```
@comin.EP_ATM_WRITE_OUTPUT_BEFORE  
def python_diagfct():  
    print("diagnostic function called!")
```

append subroutines to a callback register

```
@comin.EP_ATM_WRITE_OUTPUT_BEFORE
def python_diagfct():
    print("diagnostic function called!")
```

append subroutines to a callback register

```
@comin.EP_SECONDARY_CONSTRUCTOR
def constructor():
    handle = comin.var_get( [entrypoint], (varname, domain_id),
        comin.COMIN_FLAG_WRITE | comin.COMIN_FLAG_SYNC_HALO
    )
    ...
    np.asarray(handle) = some_value
```

read/write access to model variables

```
@comin.EP_ATM_WRITE_OUTPUT_BEFORE  
def python_diagfct():  
    print("diagnostic function called!")
```

append subroutines to a callback register

```
@comin.EP_SECONDARY_CONSTRUCTOR  
def constructor():  
    handle = comin.var_get( [entrypoint], (varname, domain_id),  
                          comin.COMIN_FLAG_WRITE | comin.COMIN_FLAG_SYNC_HALO  
    )  
    ...  
    np.asarray(handle) = some_value
```

read/write access to model variables

```
comin.var_request_add((varname, domain_id), False)  
comin.metadata_set((varname, domain_id), tracer=True)
```

creating additional variables

```
@comin.EP_ATM_WRITE_OUTPUT_BEFORE
def python_diagfct():
    print("diagnostic function called!")
```

append subroutines to a callback register

```
@comin.EP_SECONDARY_CONSTRUCTOR
def constructor():
    handle = comin.var_get( [entrypoint], (varname, domain_id),
        comin.COMIN_FLAG_WRITE | comin.COMIN_FLAG_SYNC_HALO
    )
    ...
    np.asarray(handle) = some_value
```

read/write access to model variables

```
comin.var_request_add((varname, domain_id), False)
comin.metadata_set((varname, domain_id), tracer=True)
```

creating additional variables

```
domain = comin.descrdata_get_domain(domain_id)
clon = np.asarray(domain.cells.clon)
clat = np.asarray(domain.cells.clat)
```

descriptive data structures

contain information on the ICON setup, the computational grids, and the simulation

- ComIn is an interface not a coupler
- YAC instances coupler can be used in ComIn Plugins

```

@comin.EP_ATM_YAC_DEFCOMP_AFTER
def yac_define_fields():
    yac_pres_sfc_source = yac.Field.create( ... )
    if rank == 0:
        yac_pres_sfc_target = yac.Field.create( ... )
        yac.def_couple(
            "comin_example_source", "comin_icon_grid", "pres_sfc",
            "comin_example_target", "comin_example_grid", "pres_sfc",
            ... )

@comin.EP_ATM_TIMELOOP_END
def process():
    yac_pres_sfc_source.put(np.ravel(comin_pres_sfc)[: domain.cells.ncells])
    if rank == 0:
        data, info = yac_pres_sfc_target.get()
        plt.imshow(np.reshape(data, [179, 360]))
        plt.savefig(f"pres_sfc.png")
    
```

Enable the plugin mechanism

- Make sure ICON is configured with `--enable-comin`
- In the Fortran Namelist:

```
&comin_nml
  plugin_list(1)%name      = "comin_plugin"
  plugin_list(1)%plugin_library = "libpython_adapter.so"
  plugin_list(1)%options   = "comin_plugin.py"
/
```

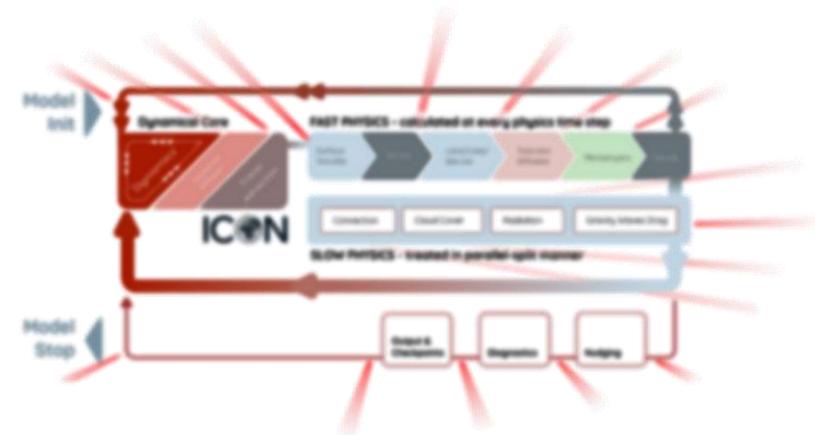

multiple plugins can be added

embedded Python
interpreter

filename of Python script passed
as an option

Entry point implementation

- Currently 41 entrypoints implemented in ICON
- New entry points can be easily introduced:
`CALL icon_call_callback(...)`
- **Granularity:** above block loop level, only global variables are exposed, only process-local partitions can be accessed directly
- **ICON calls ComIn, not vice versa!**
processes in the host model are not switched off, but can only be deactivated using ICON namelist switches

Project history and status

Project started as a
collaboration:
DWD, DLR-IPA, DKRZ and FZJ

2022

2023

Design white paper and
mock-up completed

ComIn v0.1.0 is part of the
first ICON Open Source Release

Jan 2024

Oct 2024

ComIn v0.2.0 released

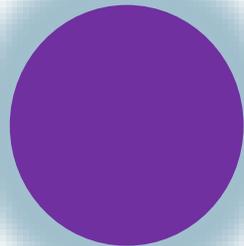

Release ComIn v0.3.0
(adds data types, C++
refactoring, ...)

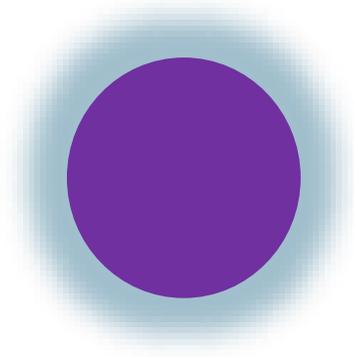

April 2025

ICON Community Interface :: User Guide

The Community Interface (ComIn) organizes the data exchange and simulation events between the ICON model and "3rd party modules". While the adapter library is coded in Fortran 2003, it offers interfaces for incorporating plugins developed in C/C++ and Python. This document serves as a comprehensive guide for new users (plugin developers). It provides an introduction to existing plugins that have already been developed. You will find instructions on how to build and run bundled plugins with ICON on the LEVANTE and DWD-NEC platforms. The guide also covers how to develop your own plugin, offering step-by-step details on the process. Additionally, you will learn how to build ComIn standalone and use its testing mechanism to test and run your plugins without running ICON. Furthermore, the document explains how to run your plugin with ICON on GPU in LEVANTE platform. In addition to this guide, the following resources are available for further assistance:

- **Technical Documentation:** Comprehensive design documentation explains the implementation of source code in ComIn and ICON.
- **ComIn Python API:** A comprehensive list of available global ComIn functions, variables, and constants that can be used in ComIn Python plugins.

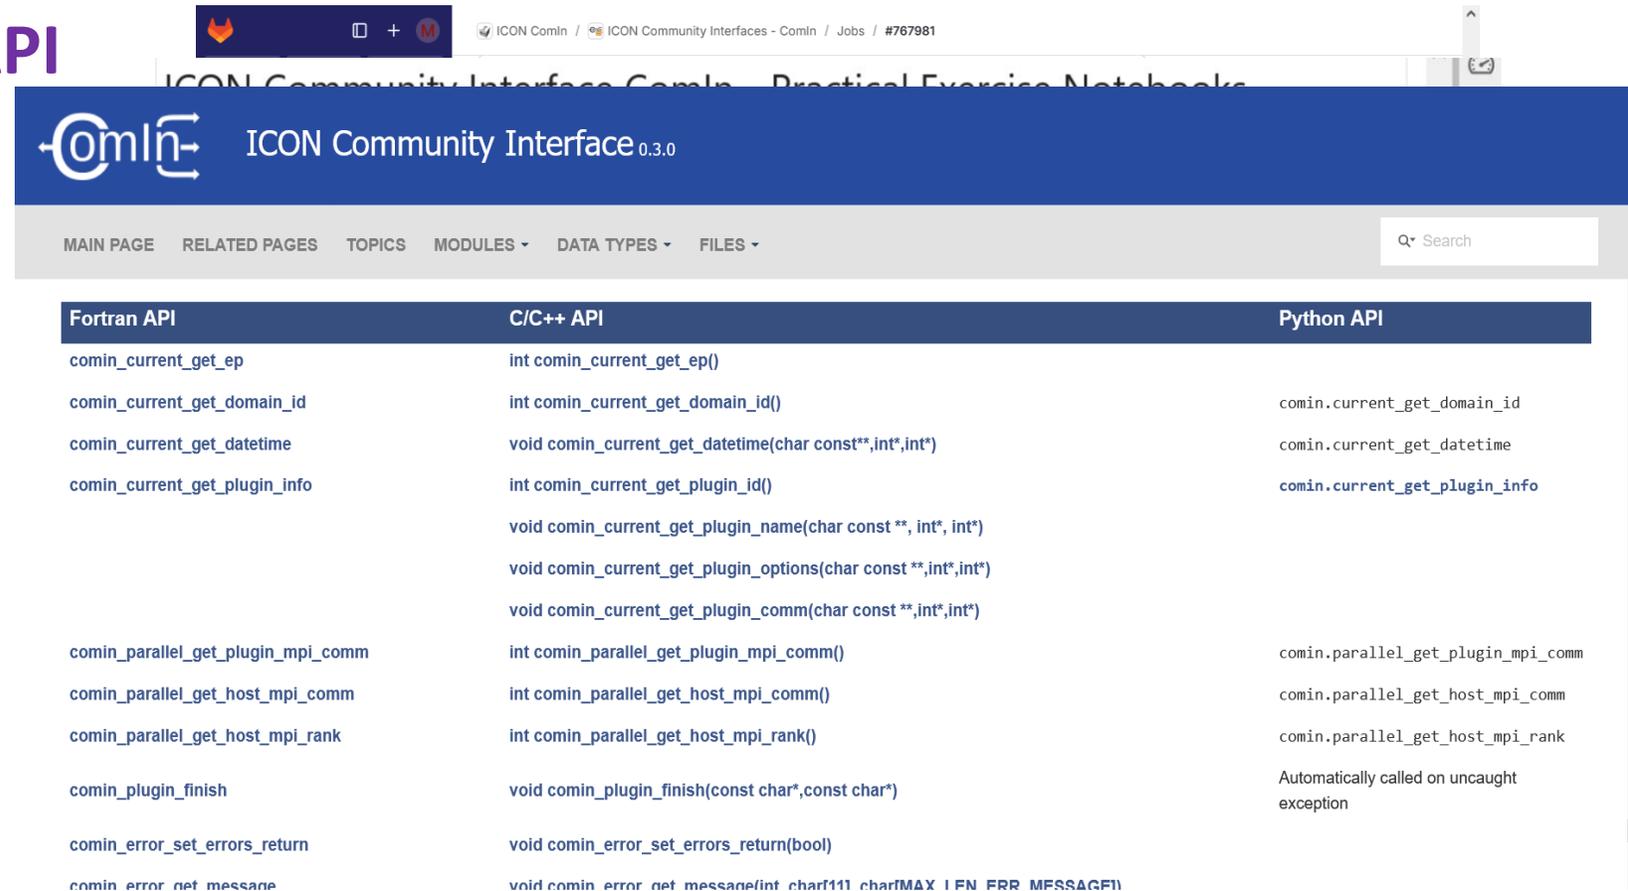

Table of Contents

- ↓ Example plugins
- ↓ Using bundled ComIn plugins
 - ↓ Repository checkout
 - ↓ Example plugins
 - ↓ Adding the namelist comin_nml to the ICON's namelist file
- ↓ Build instructions for the Levante platform
 - ↓ ComIn-enabled ICON installation on Levante_gcc
 - ↓ Modifying the ICON run script
 - ↓ Run the experiment on Levante
- ↓ DWD NEC platform
 - ↓ Limitations

- Prepared for Levante platform

ICON ComIn / ICON Community Interfaces - ComIn / Jobs / #767981

ICON Community Interface ComIn - Practical Exercise Notebooks

Exercise P2: Masking (Non-)Prognostic Cells

- **Exercise P2:** In this exercise, we explore what prognostic cells are and learn how to define a mask for them using Python.
- This exercise is an extension of `P1_exercise`. To proceed, ensure that you have the binary `icon` configured with the `--enable-comin` option and the ComIn Python adapter obtained in the **previous exercise**.

Introduction:
The computational domain in ICON:

- **Domain decomposition** is essential for achieving scalability in grid point models on modern parallel computers.

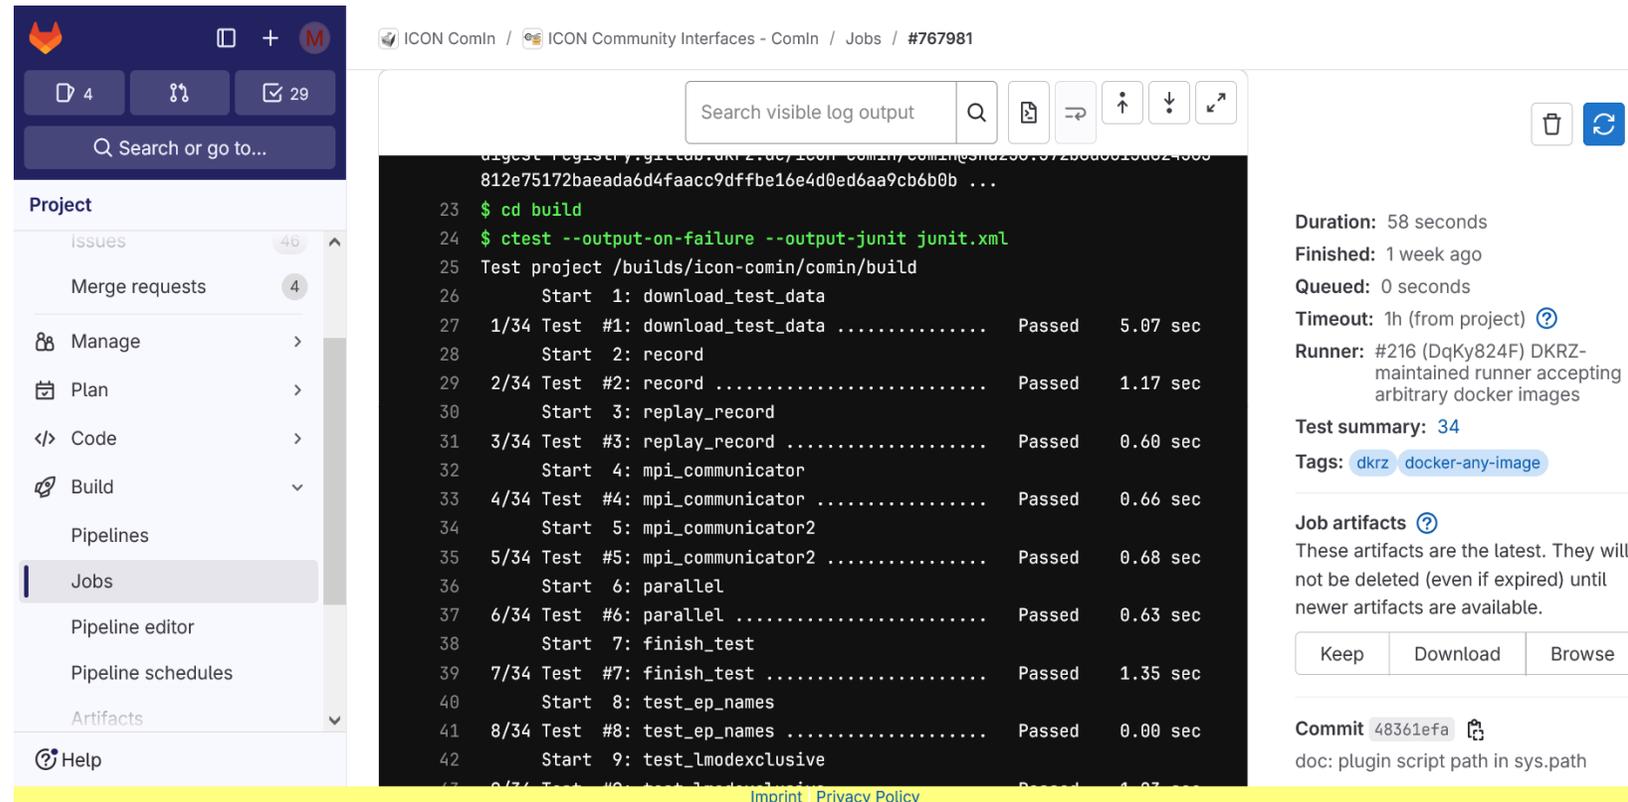

The diagram illustrates the computational domain split into two parts: **Domain Part PE #0** (left) and **Domain Part PE #1** (right). A **Halo Region** is shown between them, with arrows indicating data exchange. A **Nudging** region is also indicated within the domain. The domain is composed of a grid of cells, with some cells labeled with numbers (1, 2, 3, 4) representing different cell types or states. A **Lateral Boundary** is also shown at the bottom of the domain.

Key Resources

record & replay tool

- Makes use of previously recorded ICON datasets
- **record & replay** is very helpful for developing plugins
- It can act as a **host model**
- Run plugin with *ctest* functionality

The screenshot shows a GitHub Actions workflow run for the project 'ICON ComIn'. The workflow is titled 'ICON Community Interfaces - ComIn / Jobs / #767981'. The main content is a log of test results for a job named 'build'. The log shows the following steps and results:

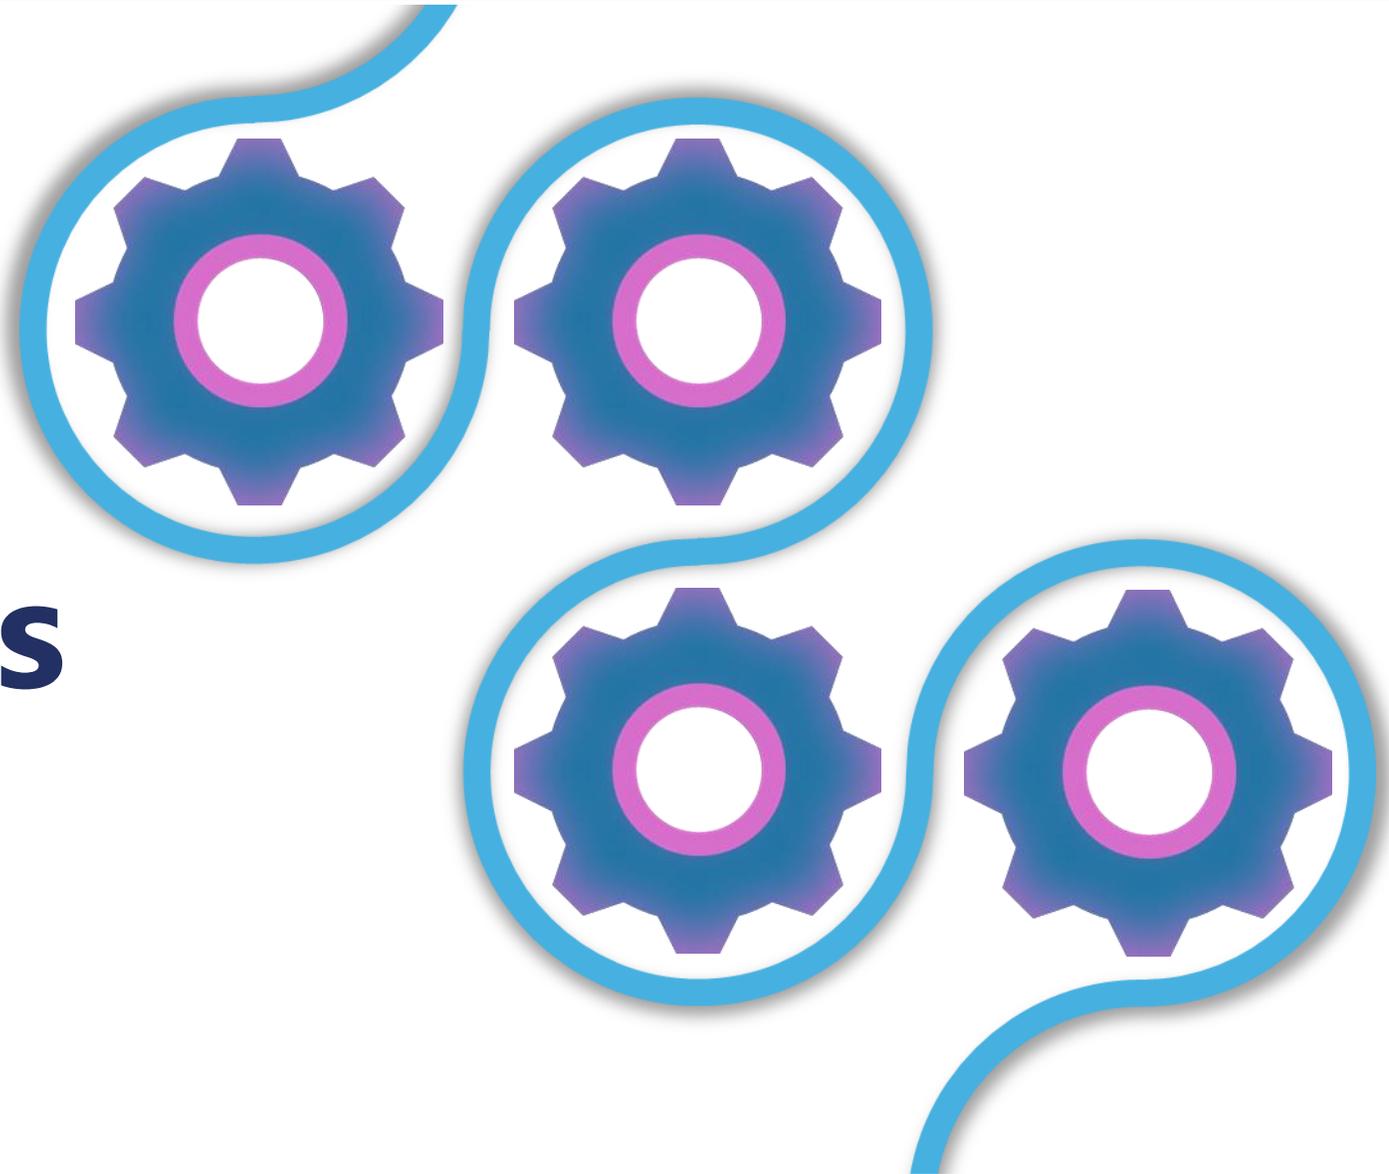

```

23 $ cd build
24 $ ctest --output-on-failure --output-junit junit.xml
25 Test project /builds/icon-comin/comin/build
26   Start 1: download_test_data
27 1/34 Test #1: download_test_data ..... Passed   5.07 sec
28   Start 2: record
29 2/34 Test #2: record ..... Passed   1.17 sec
30   Start 3: replay_record
31 3/34 Test #3: replay_record ..... Passed   0.60 sec
32   Start 4: mpi_communicator
33 4/34 Test #4: mpi_communicator ..... Passed   0.66 sec
34   Start 5: mpi_communicator2
35 5/34 Test #5: mpi_communicator2 ..... Passed   0.68 sec
36   Start 6: parallel
37 6/34 Test #6: parallel ..... Passed   0.63 sec
38   Start 7: finish_test
39 7/34 Test #7: finish_test ..... Passed   1.35 sec
40   Start 8: test_ep_names
41 8/34 Test #8: test_ep_names ..... Passed   0.00 sec
42   Start 9: test_lmodexclusive
43 9/34 Test #9: test_lmodexclusive ..... Passed   1.07 sec
  
```

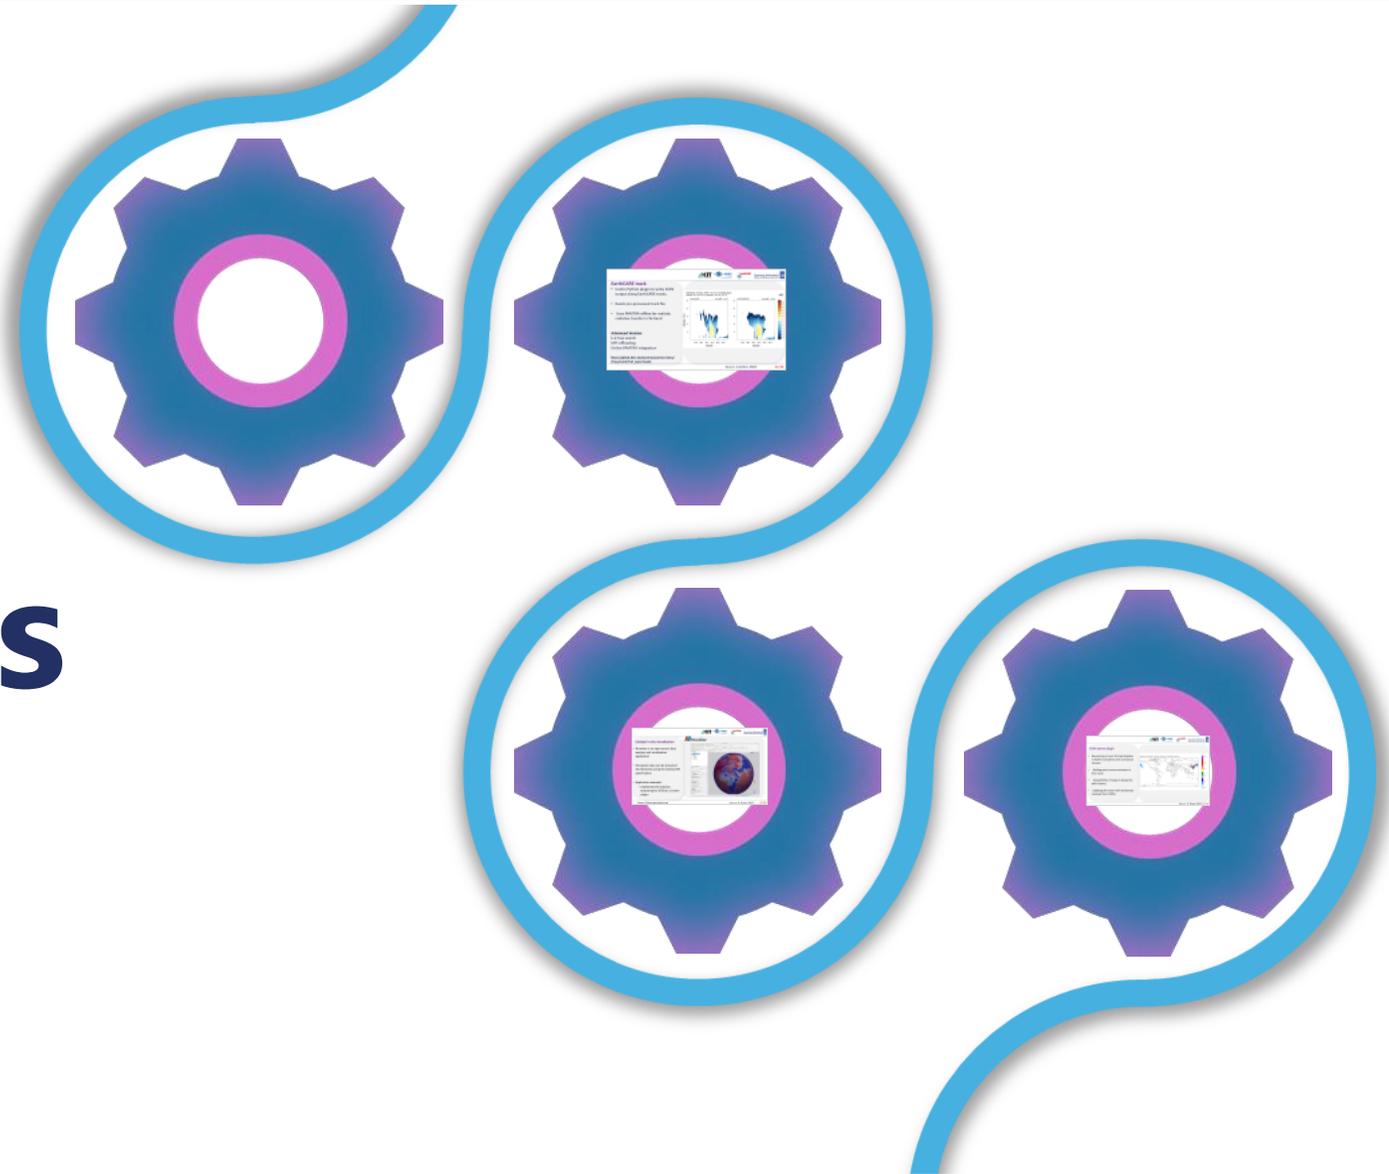

On the right side of the screenshot, there is a summary of the job:

- Duration: 58 seconds
- Finished: 1 week ago
- Queued: 0 seconds
- Timeout: 1h (from project)
- Runner: #216 (DqKy824F) DKRZ-maintained runner accepting arbitrary docker images
- Test summary: 34
- Tags: dkrz, docker-any-image
- Job artifacts: These artifacts are the latest. They will not be deleted (even if expired) until newer artifacts are available.
- Commit: 48361efa
- doc: plugin script path in sys.path

Applications

Applications

Point source plugin

- Requesting a tracer that participates in ICON's turbulence and convection scheme
- Adding point source emissions to this tracer
- Using *KDTree* of *scipy* to locate the point source
- Updating the tracer with tendencies received from ICON's

Point Source 141.0E, 37.4N, lev=10 (17km) - 2014-06-03 00 UTC

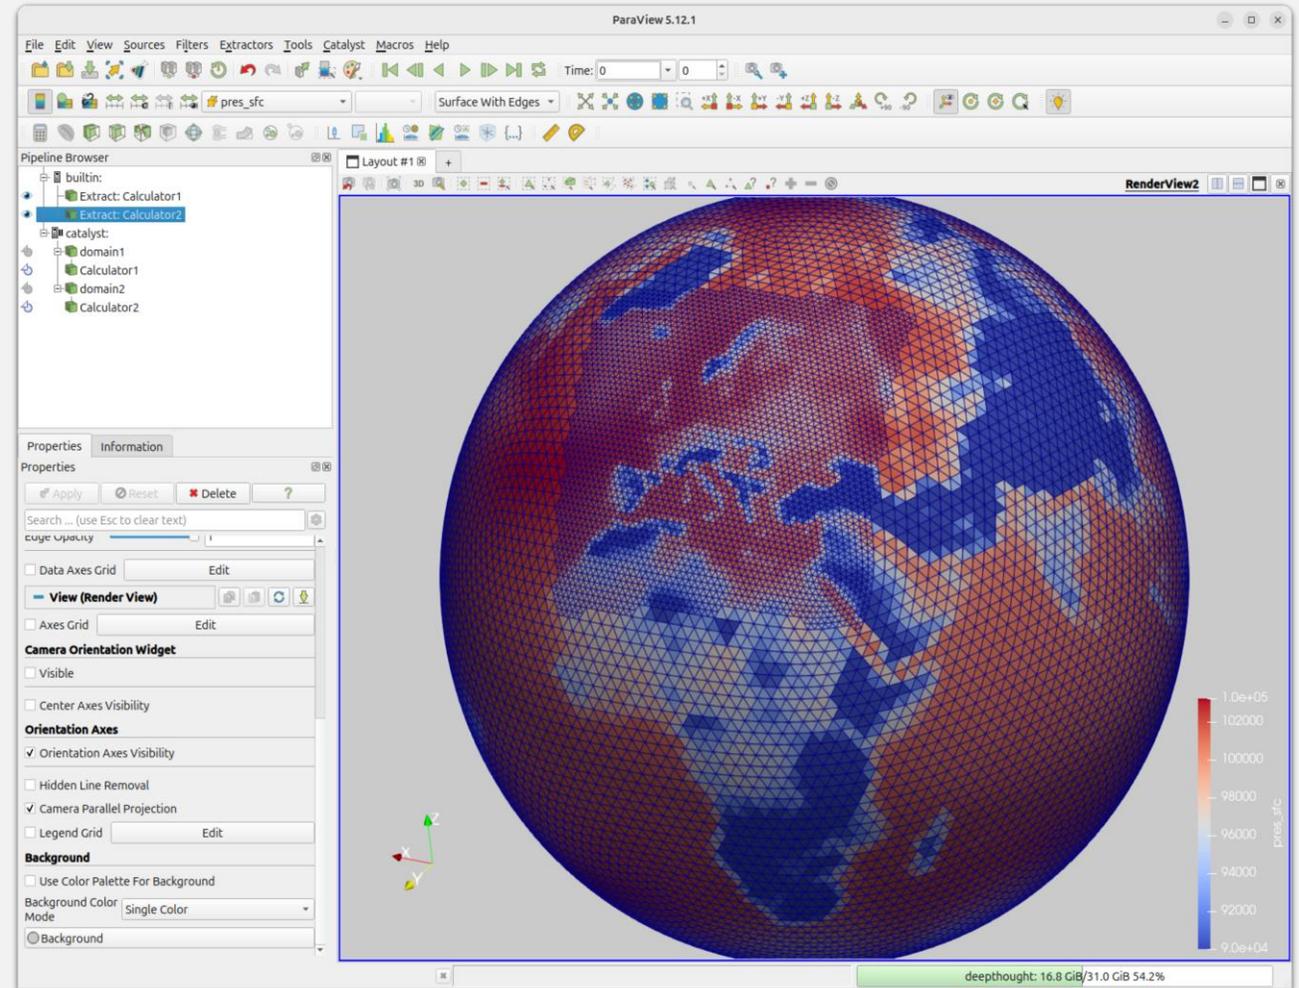

Catalyst in situ visualization

ParaView

- Paraview is an open-source data analysis and visualization application
- Simulation data can be streamed into Paraview using the Catalyst API specification.
- Application example:
 - Implement the Catalyst streaming for ICON as a ComIn plugin.

EarthCARE track

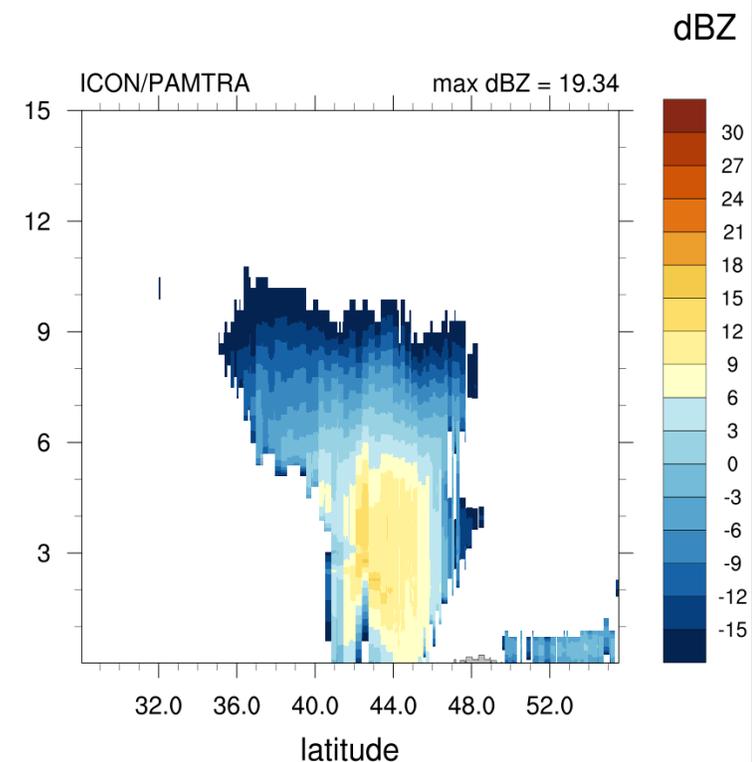

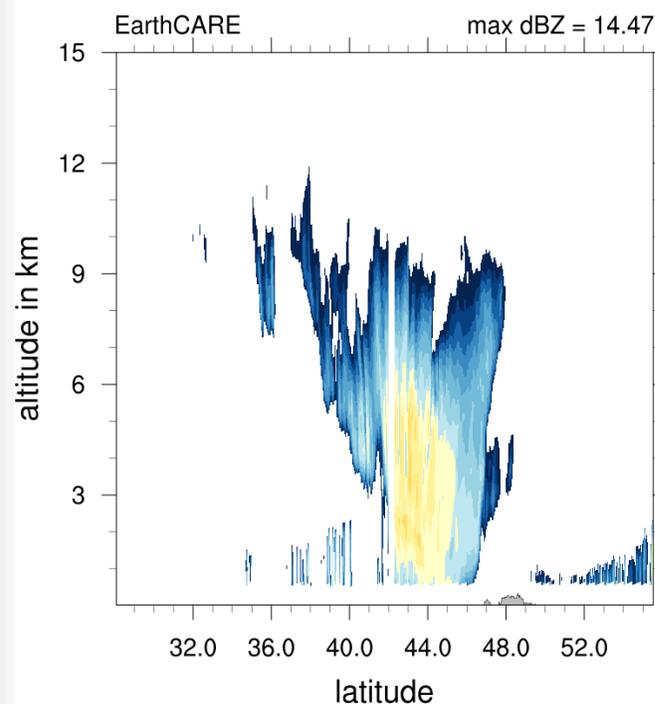

- ComIn Python plugin to write ICON output along EarthCARE tracks.
- Reads pre-processed track file
- Uses PAMTRA offline for realistic radiative transfer in W-band

Advanced Version:

k-d tree search
MPI offloading
Online PAMTRA integration

https://gitlab.dkrz.de/pamtra/pamtra-insitu/-/tree/comin?ref_type=heads

2025/02/01, 00 UTC, 18:08 - 18:15 h of icon058_gscp3
latitude: 28.1 to 55.5 N, longitude: -60.4 to -52.1 E
